On the structure of near-record values

Raúl Gouet\textsuperscript{1}, F. Javier López\textsuperscript{2}, Gerardo Sanz\textsuperscript{2}

SUMMARY

Near-records of a sequence are observations lying within a fixed distance of the current record \cite{Balakrishnan2005}. In this work we study the structure of near-record values, showing that they can be seen as a nonhomogeneous Poisson cluster process. Based on this representation we derive some properties of near-record values. We also show how near-records can be used in inferential procedures, improving classical estimations based on record values only.

Keywords: Records, near-records, cluster Poisson process, maximum likelihood estimation.

AMS Classification: 60G70, 60G55, 62F10.
